

NUMPY RANDOM NUMBERS:

1. np.random.rand :

It generates an array with random numbers that are uniformly distributed between '0' and '1'.

2. np.random.randn :

It generates an array with random numbers that are normally distributed, mean = 0 and std dev (standard deviation) = 1.

3. np.random.randint :

It generates an array with random numbers (integers) that are uniformly distributed between '0' and given number.

4. np.random.uniform :

It generates an array with random numbers (float) between given numbers.

NOTE: NumPy arrays are mutable.

NUMPY SLICING:

(138)

Slicing means taking elements from one given index to another given index.

↳ We pass slice instead of index as

[start : end]

↳ We define the step as [start : end : step]

↳ If we don't pass start it is considered as '0'.

↳ If we don't pass end it is considered as length of array in that dimension.

↳ If we don't pass step it is considered as '1'.
